

Intra Hoof-fit

Intra Hoof-Fit Gel, Liquid and Bath

The Intra Hoof-Fit Gel, Intra Hoof-Fit Liquid, and Intra Hoof-Fit Bath products enable cattle and sheep farmers to treat the hooves of their cows and sheep and to keep them in a healthy condition. If the animals still become afflicted, these products fully support medical treatments. Intra Hoof-Fit Gel is ideally suited to treat individual animals. Intra Hoof-Fit Liquid has been especially developed for groups of animals. Treatment should preferably be done using a low pressure sprayer. Intra Hoof-Fit Bath has been especially developed for preventive treatments and can best be given using the Intra Bath. These products have been developed in close co-operation with dairy farmers, veterinarians, hoof-trimmers, and cattle specialists and have all been thoroughly field tested.

The Intra Bath

Intracare has developed the Intra Bath together with dairy farmers, hoof trimmers, and veterinarians. The Intra Bath consists of three easy-to-assemble parts: two synthetic baths, and a metal grill. Compared to traditional baths, the Intra Bath has the following **ADVANTAGES**:

- **Less pollution**- 60% of the manure falls through the middle grill and not into the bath.
- **More cost effective**- Intra Bath has a guaranteed 30% lower capacity compared to a traditional bath. More cows can be treated, while using less product.
- **More contact time**-each cow makes an extra step in the bath.
- **Three separate parts with easy assembly**
- **Environment-friendly**- needs less product per treatment.
- **Easy to handle**- the bath is easy to fill, empty, and clean.
- **Double walled plastic, with 4 handles on each tub**

IntraHoof-fit Gel

Intra Hoof-Fit Gel

For individual treatment

1. Trim the claws 2 to 3 times per year. All animals should preferably be trimmed by a professional trimmer.

2. Clean the claw thoroughly. Make sure that any manure is removed from the claw and the inter-digital space. Dry the claw.

3. Apply Hoof-Fit Gel to the claw and the inter-digital space using the brush provided.

4. Because of its super concentrated adhesive bonding, Hoof-Fit Gel will remain effective for 4 to 5 days. Repeat the treatment if necessary.

5. In very serious cases, we advise you to tape the claws. After a maximum of 4 days, the tape must be removed and the treatment repeated with Hoof-Fit Gel (this time without tape).

IntraHoof-fit Liquid

Intra Hoof-Fit Liquid

For group treatment

1. Tether the animals to the grid of the feeding trough.

2. Rinse the claws clean with water, including the inter-digital space.

3. Prepare a solution of 50% Hoof-Fit Liquid and 50% water.

4. Using a low-pressure sprayer, spray the Hoof-Fit Liquid onto the back of each claw and into the inter-digital space.

5. For the first 3 treatments, apply a 50% solution; afterwards, treat the claws on a weekly basis with a 20% solution.

IntraHoof-fit Bath

How to use the Intra Bath and Hoof-Fit Bath:

1. Press both baths into the rails of the grill. Push the grill firmly into the baths with your feet. Make sure the baths are secured tightly to the grill.

2. Fill the baths with at least 15 cm of water. (The total content of each bath is approximately 80 litres.) Add 4 litres of Hoof-Fit Bath per bath (this would make a solution of 5%)

3. After approximately 250 cow-passes, we recommend refreshing the baths.

4. Remove the grill and empty the baths.

5. The Intra Bath is easy to store. Simply put the grill into one part of the bath and put the other part of the bath on top of it.
